Our Questions

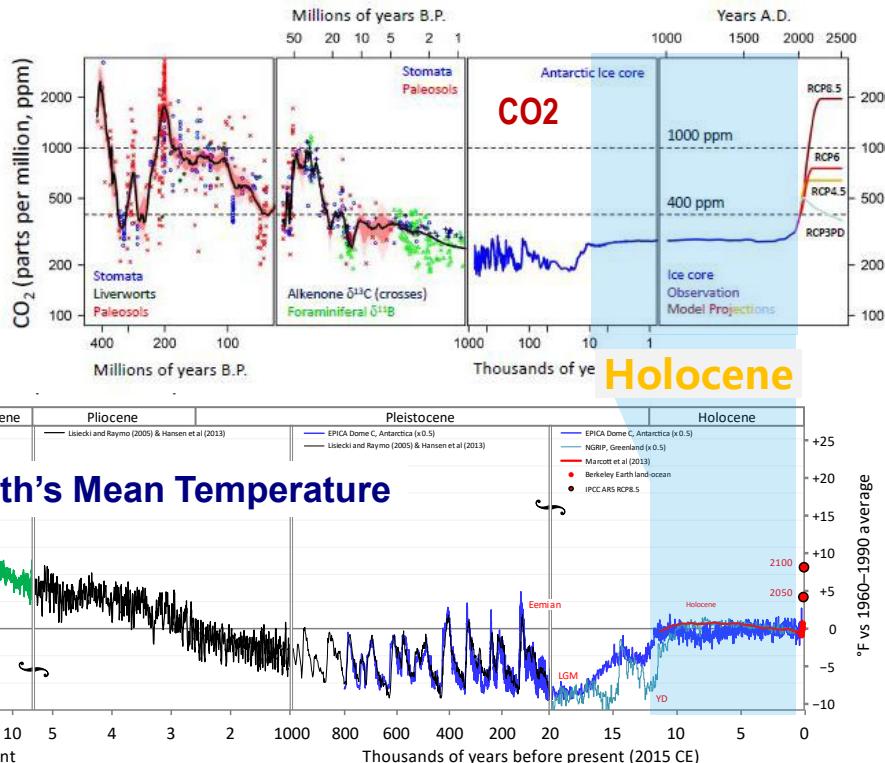

500±300 Years

1. *Natural Centennial-Millennial oscillation* in climate system?

地球气候系统是否存在百年-千年尺度自然振荡? (Yes!)

*What component of the Earth's climate system can provide
multicentennial timescale?*

Great Conveyor Belt: *Thousands' Years*

AMOC

- Surface flow
- Deep flow
- Bottom flow
- Deep Water Formation

- Wind-driven upwelling
- Mixing-driven upwelling
- Salinity > 36 ‰
- Salinity < 34 ‰

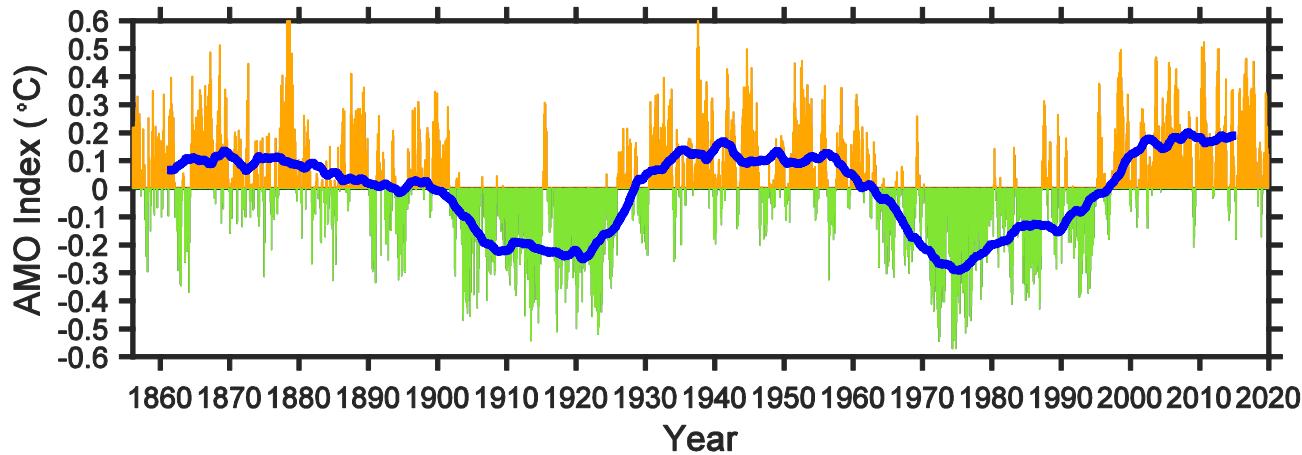

- L Labrador Sea
- N Nordic Seas
- W Weddell Sea
- R Ross Sea

Advection timescale: *Thousands' years*
→→ Timescale for multicentennial variability

AMO: 60-80 Years

Tons of studies on *decadal* (20-30 yr) & *multi-decadal* (60-80 yr) variabilities

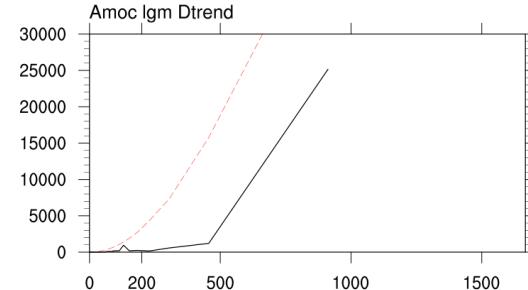

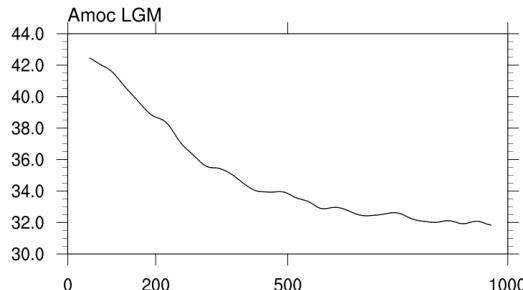

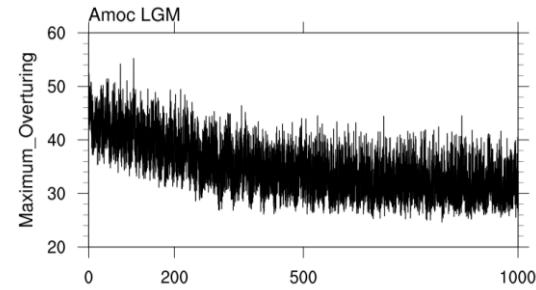

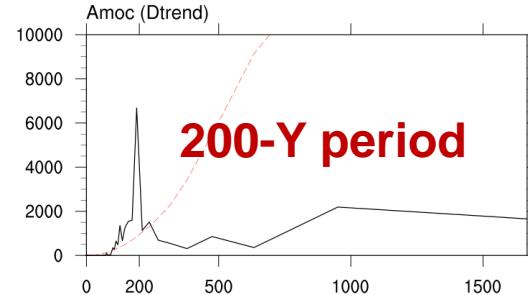

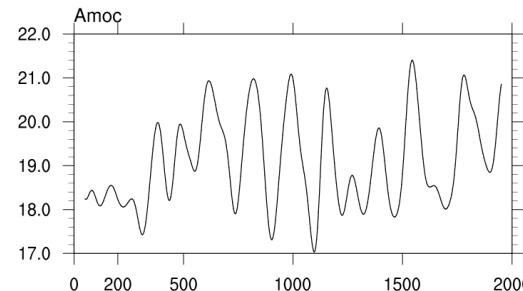

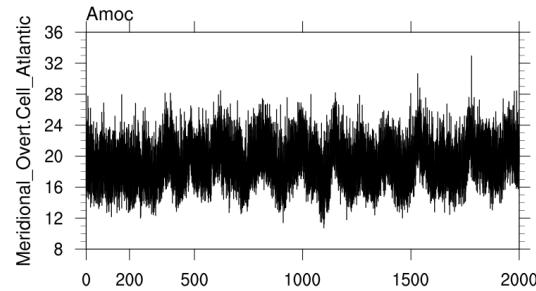

No direct evidences of **multicentennial** variability

Kaplan SST (Kaplan et al., 1998; Drinkwater et al., 2014)

Centennial Oscillation in EC-Earth3 Model

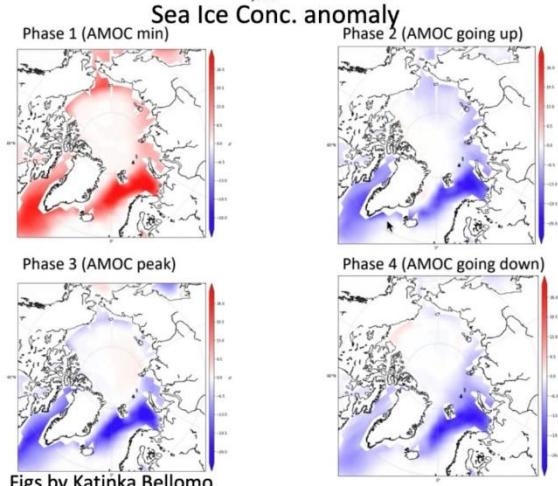

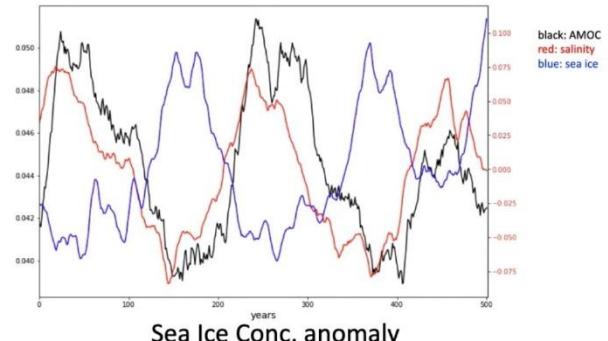

2000 Years period PI control experiment

Zhang et al. (2021)

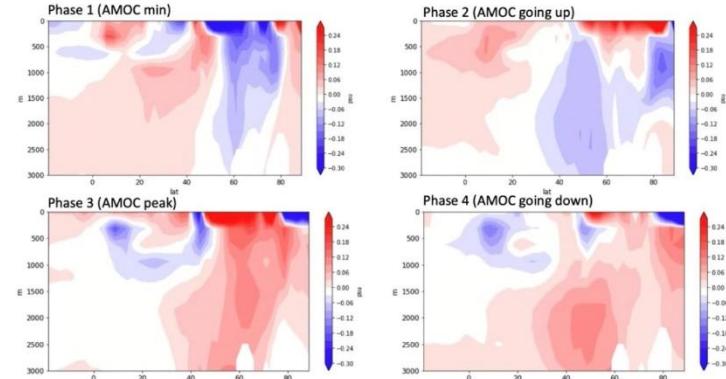

Exists also in Other Models ...

An example of topic of possibly broader interest: Oscillations in PI EC-Earth simulations

Salinity anomaly

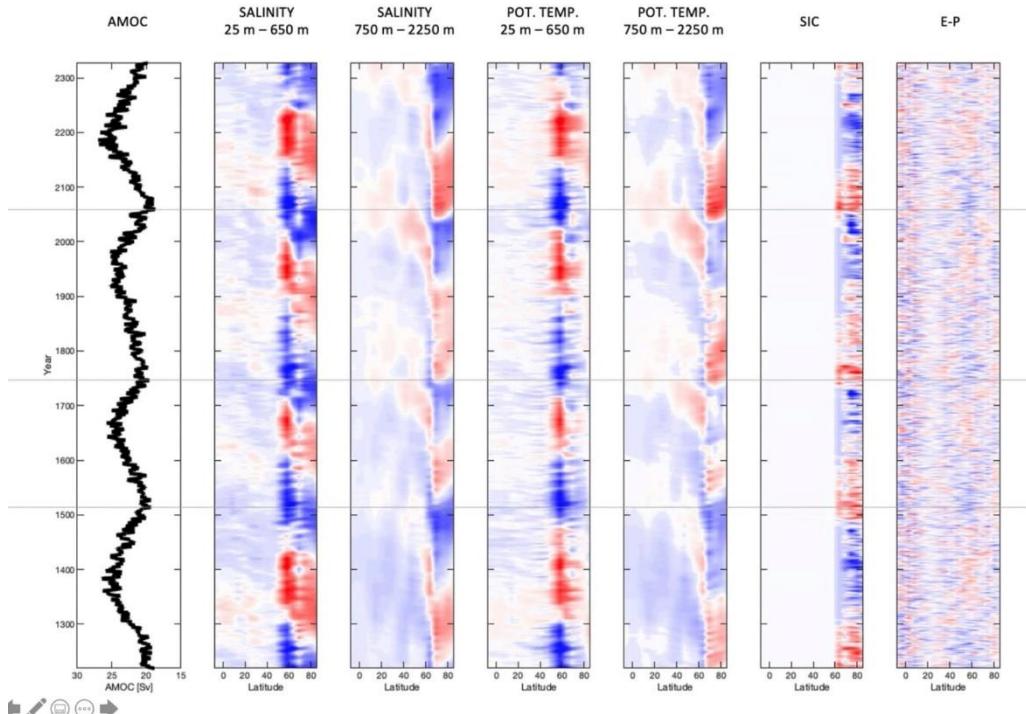

An understanding of these oscillations has implications for:

- better tuning and creation of equilibrated ICs of the model
- Interdecadal variability in EC-Earth
- Paleoclimate and tipping points
- A better understanding of mechanisms associated with AMOC decrease in projections

2-Box Model and Multi-Equilibrium

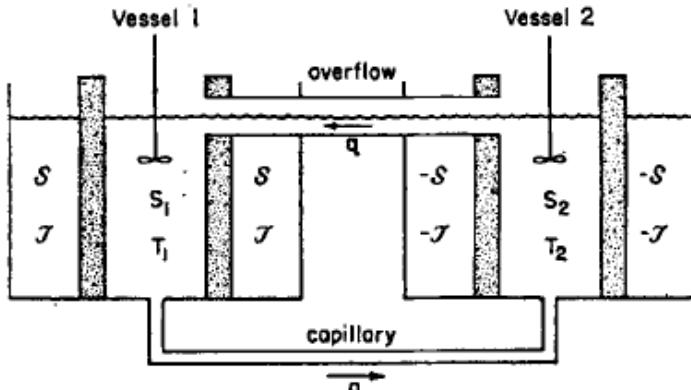

Thermohaline Convection with Two Stable Regimes of Flow

By HENRY STOMMEL, Pierce Hall, Harvard University, Massachusetts

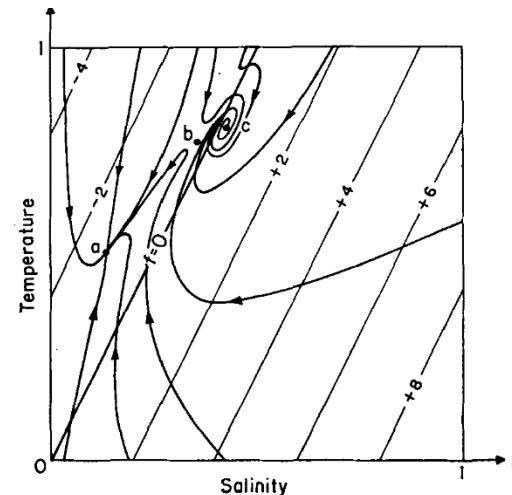

(Manuscript received January 21, 1961)

Abstract

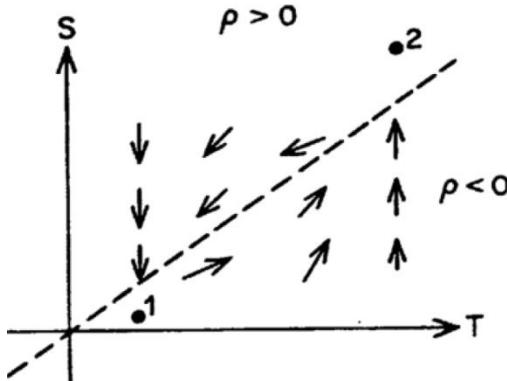

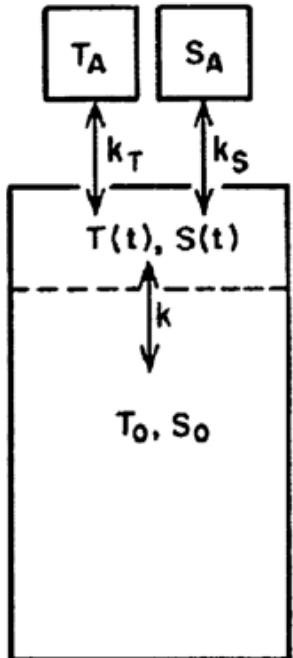

Free convection between two interconnected reservoirs, due to density differences maintained by heat and salt transfer to the reservoirs, is shown to occur sometimes in two different stable regimes, and may possibly be analogous to certain features of the oceanic circulation.

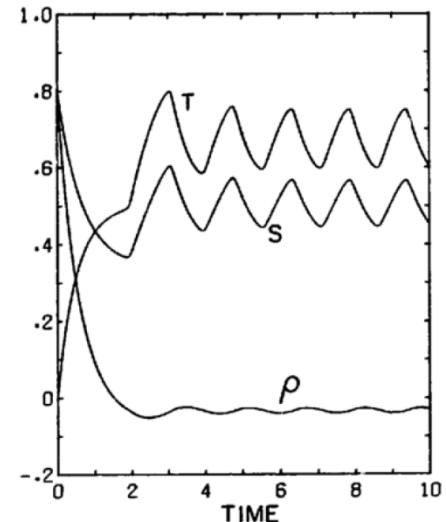

Henry Stommel (Tellus, 1961)

Thermohaline Circulation Centennial Oscillation

2-D with random forcing, 200-300 years oscillation

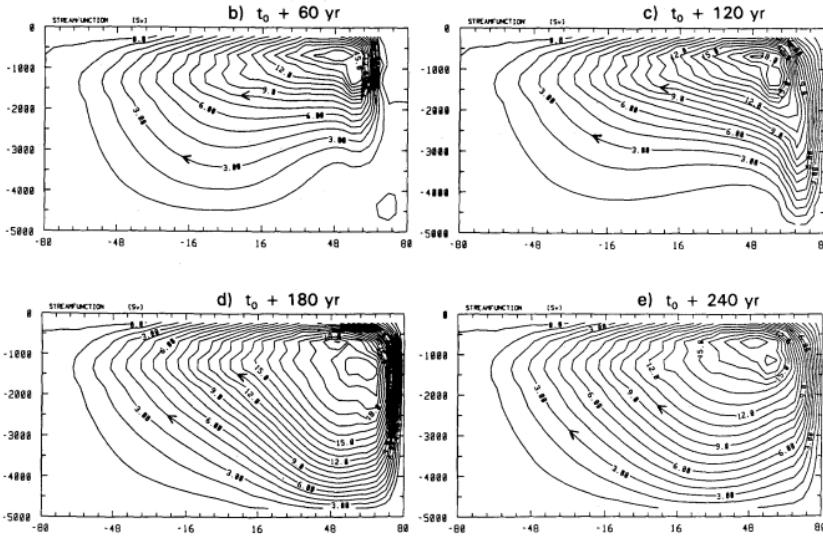

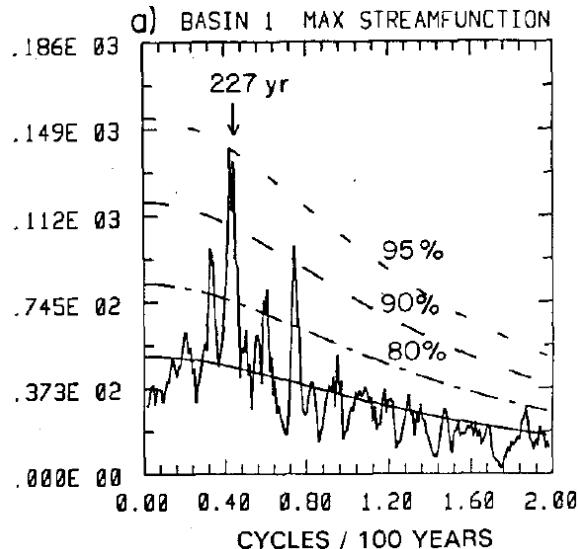

Fig. 3a-e. Streamfunction contours at 60-yr intervals which span the 240-yr oscillation EE' in Fig. 2. a $t = 6830 \text{ yr} \equiv t_0$; b $t_0 + 60 \text{ yr}$; c $t_0 + 120 \text{ yr}$; d $t_0 + 180 \text{ yr}$, and e $t_0 + 240 \text{ yr}$ (end of oscillation)

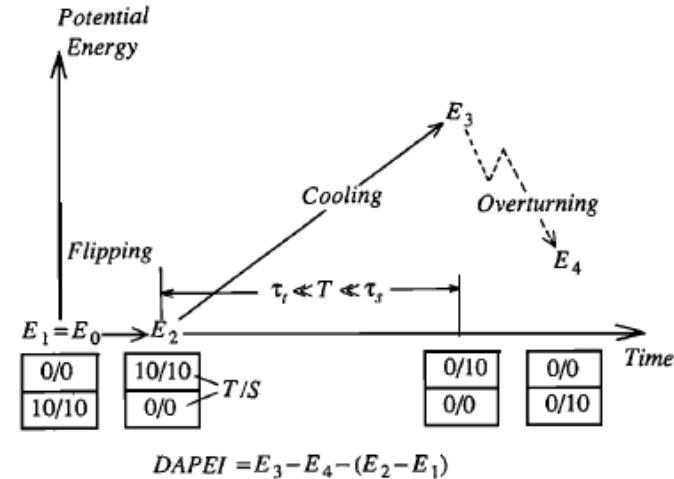

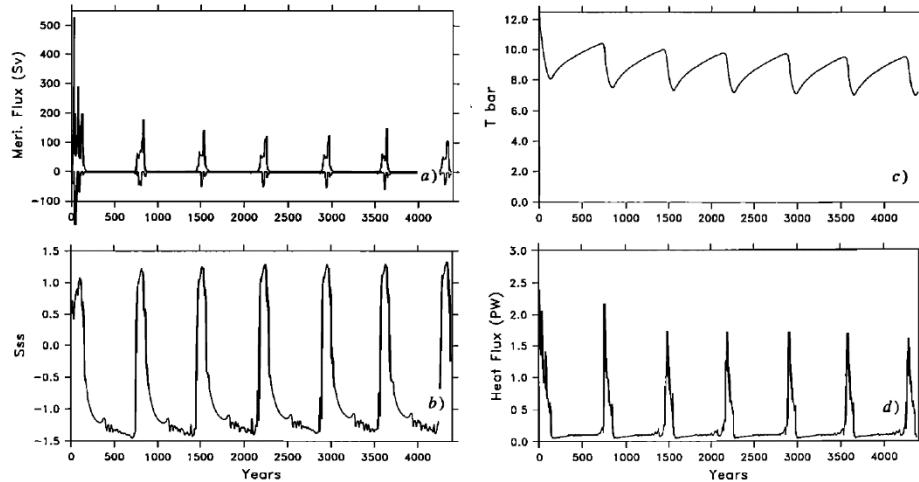

Period: 200-300 years of AMOC, Salinity advection feedback

Mysak et al., Climate Dynamics, 1993: Century-scale variability in a randomly forced, 2-D thermohaline ocean circulation model.

Energy Source: *Ocean Convection*

3-D OGCM with freshwater forcing, *centennial-millennial* oscillation

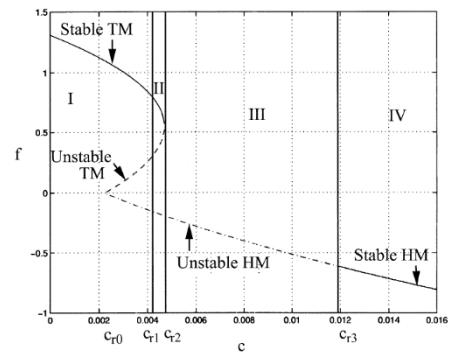

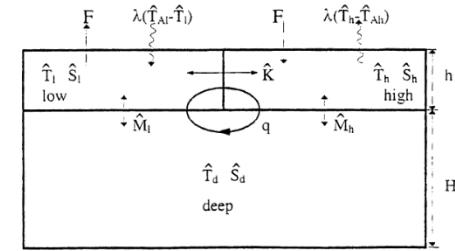

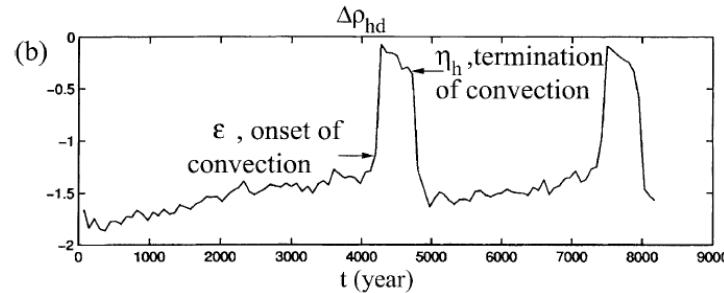

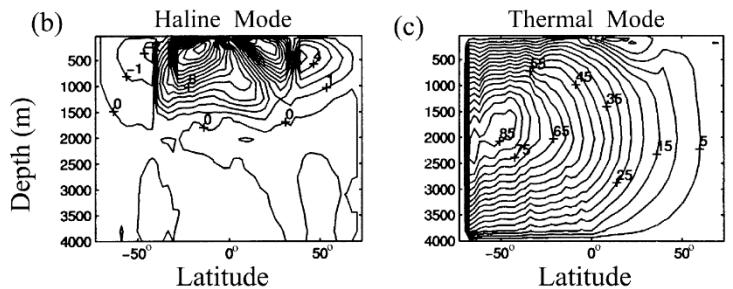

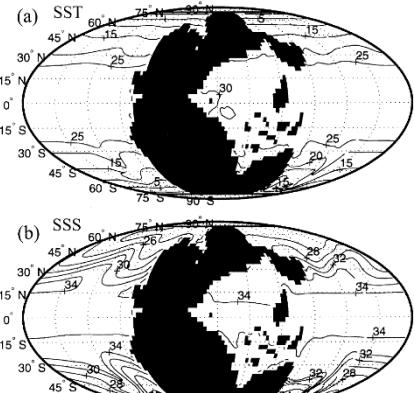

- Periodic oscillation of saline mode
- DAPE provides energy to saline mode's oscillation

Huang (1994): Thermohaline circulation: Energetics and variability in a single-hemisphere basin model. JGR-ocean

Multi-Equilibrium: *Self-Sustained Oscillation*

Late Permian, Equable climate and regime shift, *Millennial* oscillation

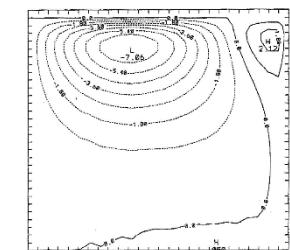

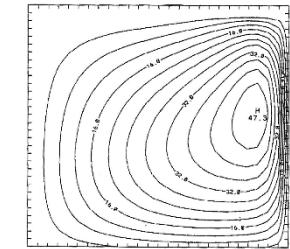

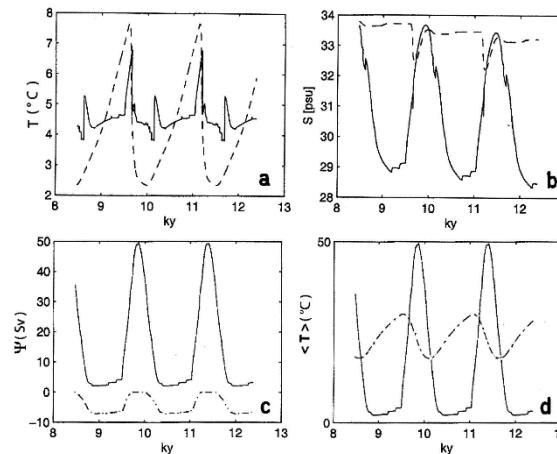

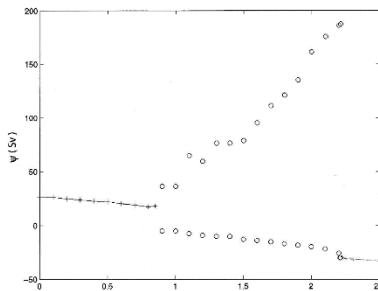

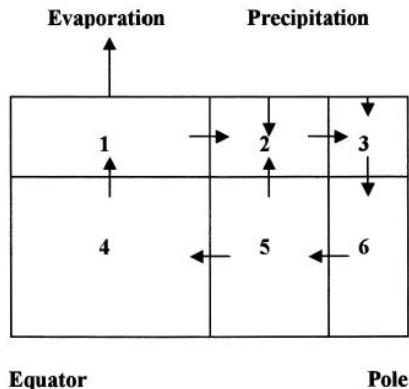

Such oscillations do not appear to occur in the modern ocean, because, apparently, the surface freshwater forcing is not strong enough. Mode switching is more likely to occur, perhaps, during glacial periods in which the freshwater forcing due to ice melting at polar regions is much stronger, or during warm equable paleoclimates such as the late Permian, or mid-Cretaceous in which the buoyancy forcing due to freshwater flux may have been stronger than the air-sea heat flux.

Zhang et al. (2002), Mechanism of thermohaline mode switching with application to warm equable climates. JC

Multi-Equilibrium: *Self-Sustained Oscillation*

Lowest-order 3x2-Box and 2D model, internal *Millennial* oscillation

\overline{q}	Equilibrium AMOC strength	$10 \text{ Sv } (10^6 \text{ m}^3 \text{ s}^{-1})$
F_w	Total virtual salt flux	$2.50 \times 10^7 \text{ psu m}^3 \text{ s}^{-1}$
β	Haline contraction coefficient	$7.61 \times 10^{-4} \text{ psu}^{-1}$
ρ_0	Reference density	$1.00 \times 10^3 \text{ kg m}^{-3}$
λ	Linear closure coefficient	$12 \text{ Sv kg}^{-1} \text{ m}^{-3}$

Theoretical Solution to 3-Box Model

Li and Yang (2022)

$$\omega = \frac{1}{2} \left[(C_2 M - C_3) \pm \sqrt{(C_2 M - C_3)^2 - 4C_2 C_4 (1 - M)} \right]$$

Stability Condition

$$M \leq \min\left(\frac{C_3}{C_2}, 1\right)$$

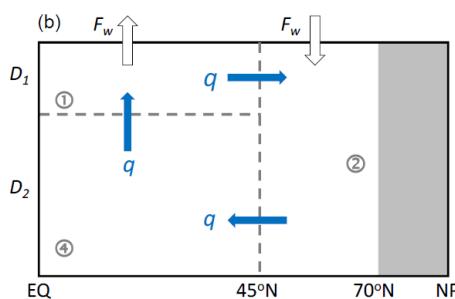

Oscillation Condition

$$M_1 < M < \min(M_2, 1)$$

$$M_1 = \frac{C_3 - 2C_4}{C_2} - \frac{2}{C_2} \sqrt{C_4^2 + C_4(C_2 - C_3)}, \quad M_2 = \frac{C_3 - 2C_4}{C_2} + \frac{2}{C_2} \sqrt{C_4^2 + C_4(C_2 - C_3)}.$$

$M = \frac{\rho_d}{\bar{q}} \lambda$: nondimensional form of λ

Stability Condition for 3-Box Model

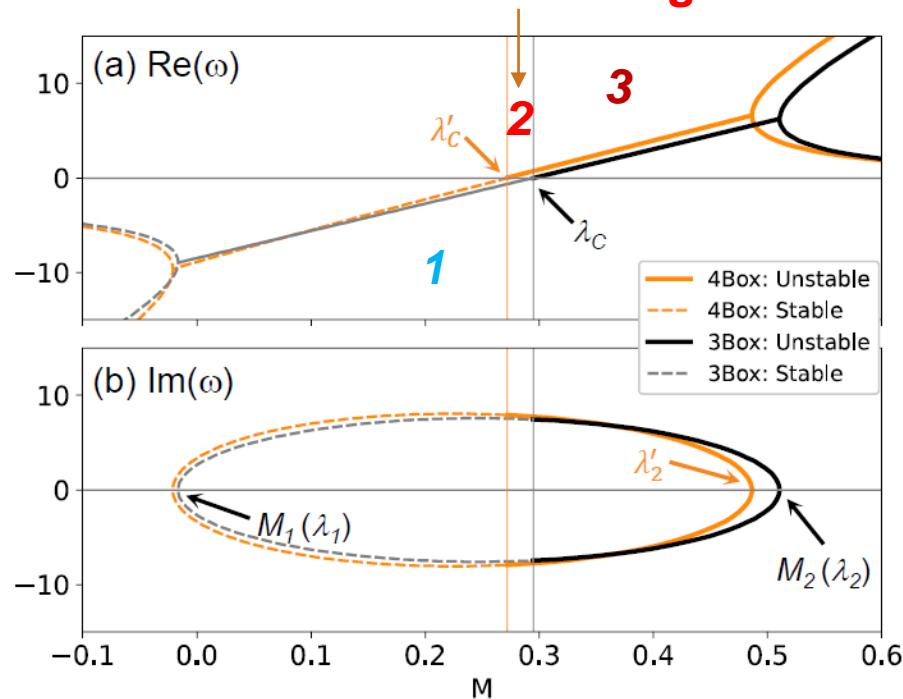

Li and Yang (2022)

$$\lambda < \lambda_C \equiv \frac{\bar{q}^2}{\rho_0 \beta \bar{F}_w} \left[1 + \frac{\delta_2}{\delta(1-\delta)} \right]$$

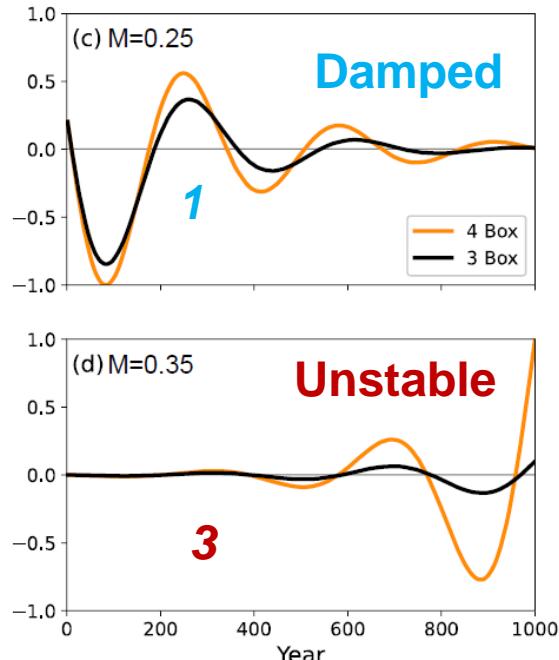

λ_C : the critical linear closure parameter when $Re[\omega] = 0$, determined by \bar{q} , \bar{F}_w and basin geometry. A stronger \bar{F}_w and a weaker \bar{q} give a smaller λ_C , implying higher possibility for an unstable oscillation, since the background meridional salinity gradient in this situation will be stronger. In addition, salinity anomalies also spend more time at the surface with a weaker \bar{q} . This will also make the system more unstable, and this is why we have a quadratic term of \bar{q} . A bigger volume of the subpolar ocean (δ_2) gives a larger λ_C , implying a higher probability for a stable oscillation. In this situation, the salinity difference anomaly between subpolar and tropical upper oceans is larger under the same q' , and thus the mean advection of salinity anomaly is stronger, which would result in a stronger stabilizing effect.

Oscillatory Modes with λ

Self-Sustained Regime

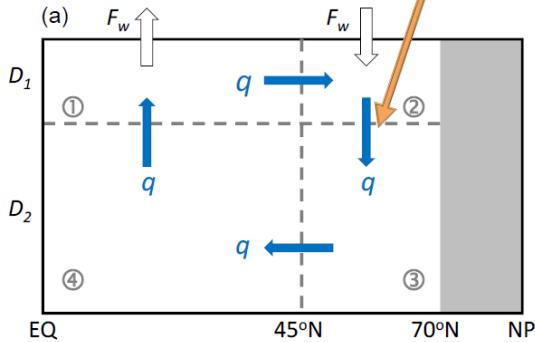

Li and Yang (2022)

How to *Realize a Self-Sustained Oscillation*?

An Enhanced Mixing or Convection

$$V_2 \dot{S}'_2 = q'(\bar{S}_1 - \bar{S}_2) + \bar{q}(S'_1 - S'_2) - k_m(S'_2 - S'_3)$$

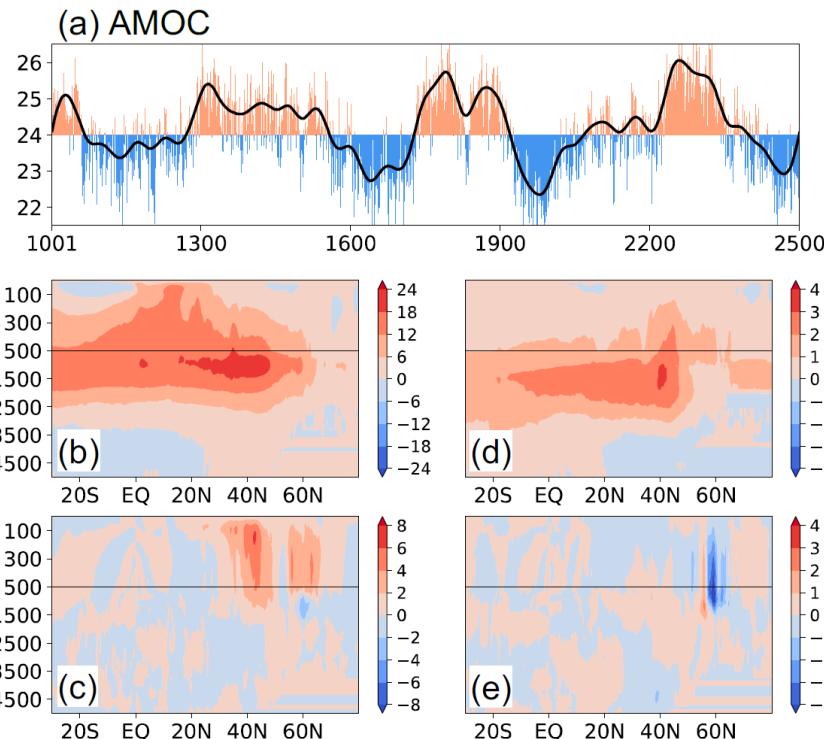

$$V_3 \dot{S}'_3 = \bar{q}(S'_2 - S'_3) + k_m(S'_2 - S'_3)$$

$$k_m = \kappa q'^2 : \text{Proportional to AMOC anomaly}$$

What *Enhanced* Mixing or Convection?

Eulerian-mean

Eddy-induced

Euler AMOC \uparrow

Vertical diffusion \uparrow

Eddy AMOC \uparrow

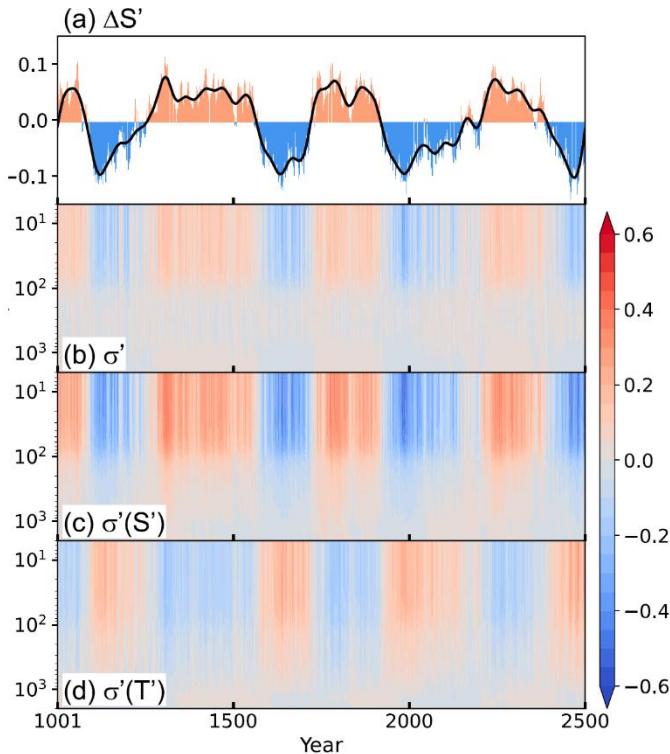

Vertical mixing \uparrow

What *Enhanced* Mixing or Convection?

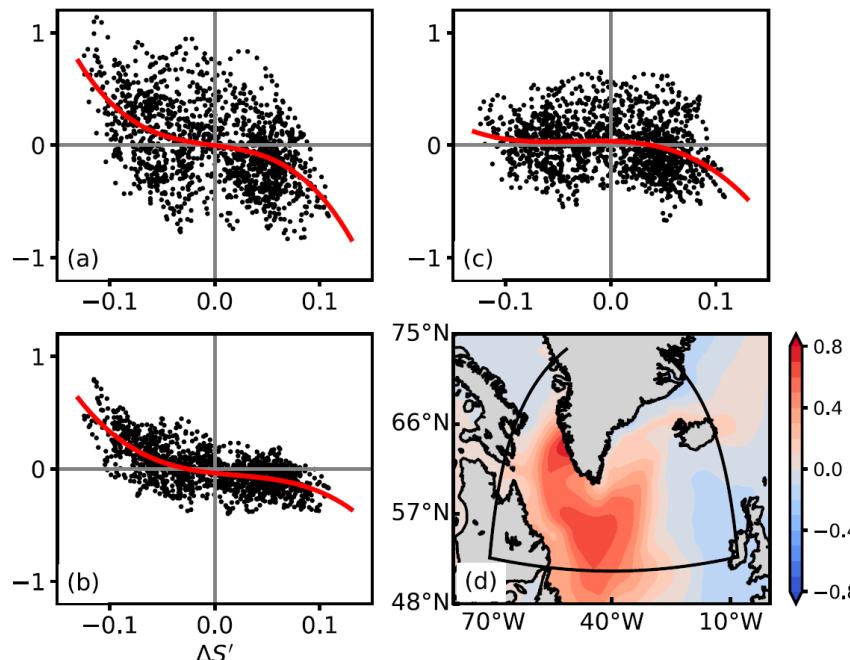

AMOC $\sim \sigma' \sim S' \sim -T'$

Stratification in Subpolar Atlantic

What *Enhanced* Mixing or Convection?

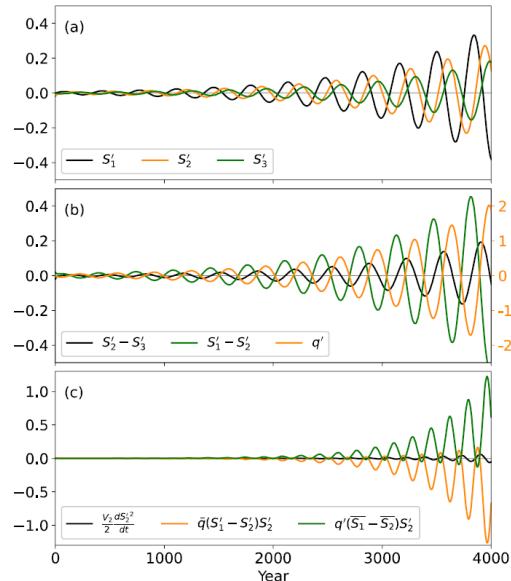

Mixing $\sim \Delta S'$

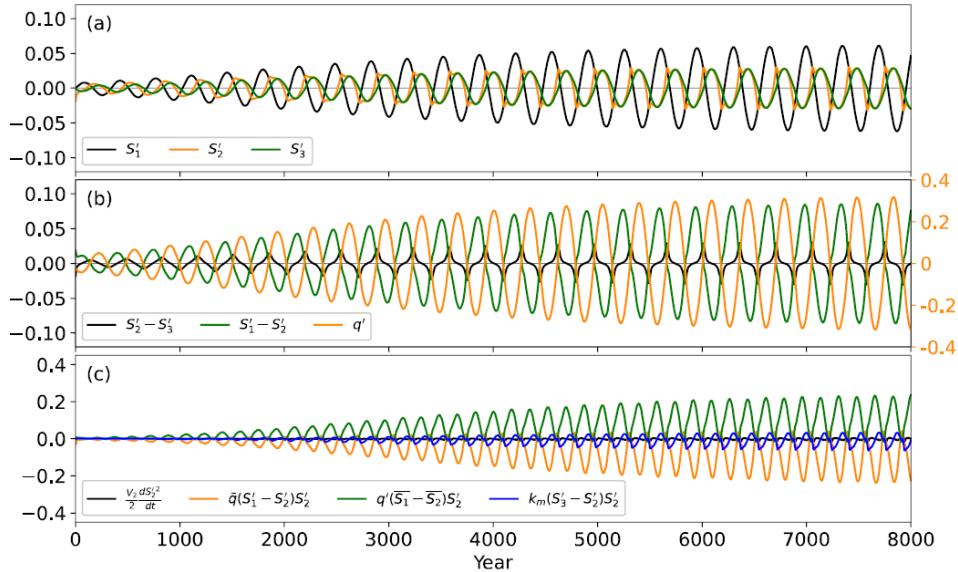

$$F_{\text{mixing}} \sim -(\Delta S')^3 \sim -(q')^2 \Delta S' \sim -k_m \Delta S'$$

Self-Sustained Oscillation

Without k_m

With k_m

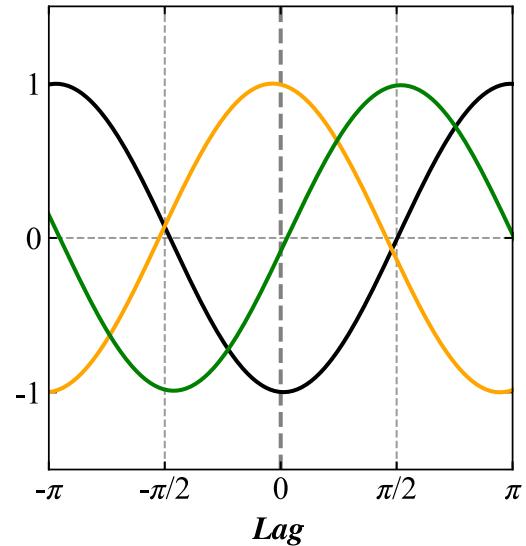

Can be only realized in 4-Box model

Controlling the AMOC change in response to the meridional density gradient change

Eigenvalues: 4TS vs 4S

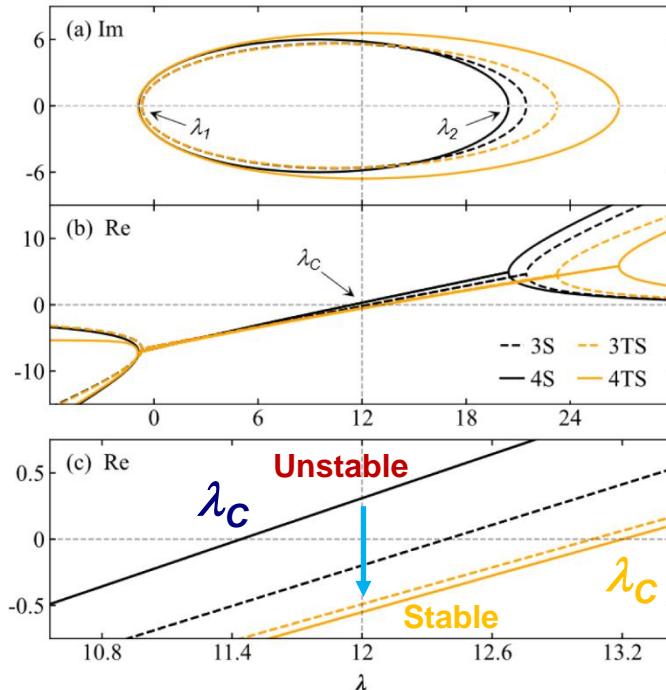

4S-box	Growing Oscillatory mode ($0.31 \pm 5.83i$)	0	-37.4
4TS-box	Damped Oscillatory mode ($-0.55 \pm 6.59i$)	0	-37.4, -366
			-366, -324 -5.28, -0.78

Oscillatory Modes with λ

Temperature
makes
system
more
damped!

Bigger
 λ_C
requires
bigger
sensitivity!

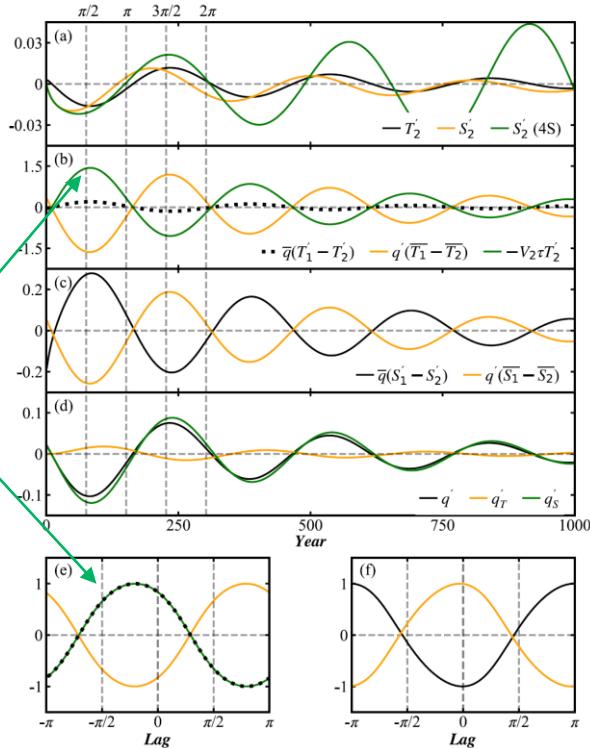

Yang et al. (2022)

Oscillation with T and S

Temperature turn
unstable into *damped!*

Positive
restoring feedback

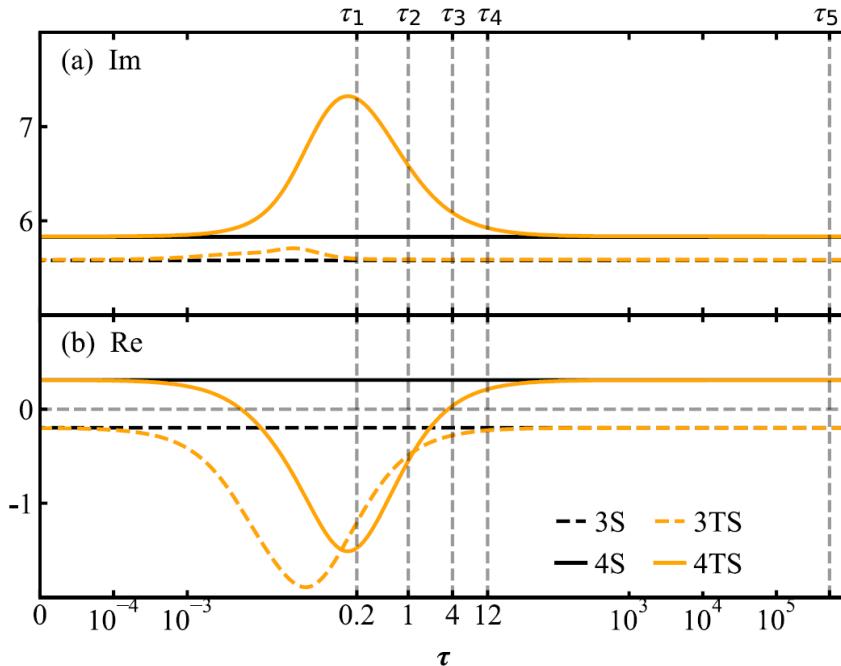

Salinity
dominates AMOC

Yang et al. (2022)

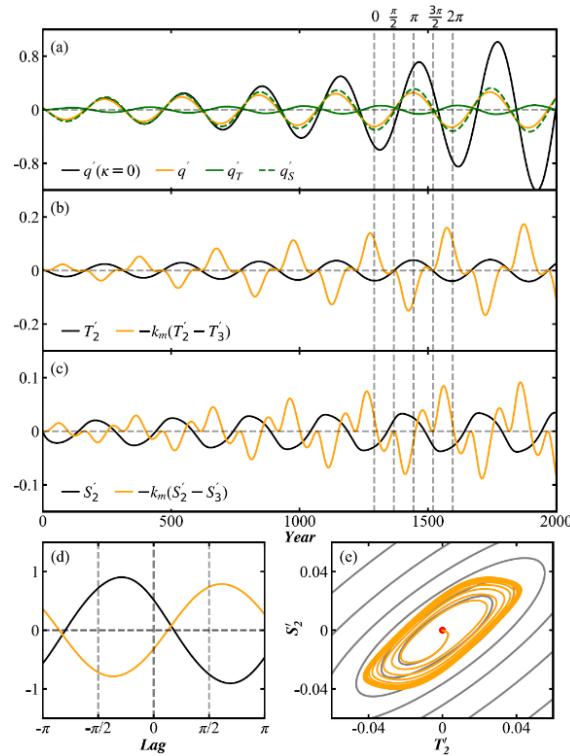

Role of *Restoring* Temperature

Restoring
feedback
Contained!
